Price 25 cents

NAS/3 6(1)

### ACKNOWLEDGEMENT

The Canadian Sickness Survey, the first nationwide study of illness in the general population of Canada, was carried out during a twelve-month period commencing in the autumn of 1950.

The Survey was initiated by the Department of National Health and Welfare and carried out by the ten provincial health departments with federal funds made available to the provinces through the National Health Program.

The planning and organization of the Survey was a joint undertaking of the Dominion Bureau of Statistics and the Department of National Health and Welfare in consultation with the provinces. Every provincial health department co-operated fully in gathering the extensive body of information which makes these publications possible.

## INTRODUCTION

The object of the Canadian Sickness Survey was to obtain estimates of the incidence and prevalence of illness and accidents of all kinds, the amount of medical, nursing and other health care received, and the volume of family expenditures for the various types of health services. The present bulletin is one of a series intended to provide a means of releasing interim information on the more important of these results, pending the preparation of a comprehensive publication containing more detailed information together with a fuller description of the methods used.

The survey method consisted of personal visits by trained lay enumerators to a sample of approximately 10,000 households distributed throughout each of the 10 provinces in metropolitan, small urban and rural areas. Less than 5 per cent of these households refused to participate in the survey. Of the remaining households over 80 per cent of the individuals involved remained in the sample throughout the survey period. All information, including particulars of income, housing and environment was obtained by direct interview of a household informant, usually the housewife. While the starting dates for the survey varied somewhat in different provinces, in most cases a total of 14 monthly visits was made to each household in the sample. On the first visit the enumerator introduced the survey and left a special calendar designed to help the informant keep a detailed day-to-day record of current sickness and expenditures for each member of the household. During each of the succeeding twelve months the enumerator interviewed the informant and recorded the sickness experienced by each person since the previous visit. The final visit was made to review the information recorded throughout the whole survey period. Uniformity of practice in the ten provinces was maintained by frequent consultation among the agencies involved, by uniform instructions to the enumerators and by the use of three standard record forms - a Household Record, an Individual Sickness Record and an Expenditure Form. Auxiliary schedules, also standardized, were used to record permanent physical disabilities and also health services which were desired but not obtained.

The sample was designed to obtain estimates within a sampling error of 20 per cent for events occurring at least once among every 50 persons in the population during the year. Indications are that for a large proportion of the estimates the error will be substantially smaller. Area sampling was used for the survey. As a first stage six domains (regions) of study were established consisting of four single provinces and two groups of three provinces each. Within each domain of study three types of area were considered - metropolitan, urban and rural. Within these areas multi-stage sampling was adopted. In metropolitan centres, all of which were included in the sample, and in some of the sampled urban areas, the first stage of sampling was the block, the second stage being the household. In other urban areas systematic sampling from a list of households was used. Rural areas were divided into primary sampling units and grouped into strata. Within each stratum one primary sampling unit was selected and multi-stage sampling applied. The first stage was the selection of clusters or segments within the primary sampling unit while the second stage was the selection of households within the chosen clusters.

In designing the sample extensive use was made of population, social and economic data obtained from 1941 Census material. Similarly the results of the 1951 Census, which was taken at about the mid-point of the survey period, provided the necessary distributions concerning persons and families for the calculation of national and provincial figures. The basic survey units for data on illness were the individual persons, while the units for expenditures on health services included families, as defined in the Census, together with certain single persons whether living alone or with other families as roomers or relatives.

HEALTH CARE EXPENDITURES

This bulletin is the third in the series of preliminary publications of the results of the Canadian Sickness Survey. The first contained general information on family expenditures for various items of health care and service as well as estimated expenditures by size of family unit. The second bulletin dealt with expenditures by the various income groups. The present report gives the distribution of family units by expenditure groups for the various items.

The figures contained in the following tables are estimates, for the whole of Canada, of family expenditures during the twelve month survey period. The estimates have been calculated from tabulations of the data obtained from families who remained in the sample throughout the survey year. They are provisional in the sense of being subject to minor adjustments arising out of changes in the estimating procedures for the provinces and regions.

The expenditures recorded in the survey were actual payments made by individuals during the survey period, regardless of what bills were received or charges made during that time, and regardless of when the service purchased was actually received. They include all such payments by all persons in the sample, even when the payments were made on behalf of other persons who might not have been in the sample. They exclude payments made from public funds or by persons not in the sample, on behalf of persons who were in the sample - for example, employers' contributions to prepayment plans and payments for health services for recipients of public assistance. Payments by several members of a family are combined for the whole family.

A family was defined, in conformity with the 1951 Census, as "husband and wife (with or without unmarried children) or parent with an unmarried child (or children) living together in the same housekeeping unit (stepchildren and adopted children are included)". All other persons, even if living with a related family in one household, were classified as single persons, or, in effect, as separate one-person families.

Each such single person, and each family is thus counted as a "family unit" in the following tables.

Expenditures for prepayment plans, whether medical care, hospital care or combined plans, represent premiums paid by individuals to those plans and not the amounts paid by the plans for hospital and medical care, the latter being excluded from all figures. It should be noted, for example, that expenditures for physicians' services in general, will be made up of prepayments for "Medical care plans", direct payments for "Physicians' services", and an unknown proportion of the amount under the items "Combined plans" and "Combined bills".

The figures shown for family units reporting expenditures indicate the number of family units with at least one member having made expenditures for that particular item. The number of family units reporting expenditures for medical care plans, for instance, means that at least one member, but not necessarily the whole family, paid into or were covered by such a plan. It is emphasized that the figures relate to actual expenditures by families or individuals and are not to be confused with the total costs of the various health services.

Family income was defined as the total income of all members of the "family unit" (see page 3) taken together. Because information of this kind is difficult to obtain, enumerators were instructed not to ask informants to state the exact amount of the family income but to indicate into which of the following five income groups their family income fell:

Under \$1,500  
\$1,500 - \$2,999  
\$3,000 - \$4,999  
\$5,000 and over  
No income

Separate estimates are presented for the first four of these income groups and for "all incomes". "All incomes" includes estimates for the first four groups, those family units reporting no income, and, those whose income was "not stated". Consequently, in Tables 37-54, the number of family units in the four income groups for which estimates are published, when added together, do not equal the totals shown under "all incomes".

Data for family units reporting "no income" and family units whose income was "not stated" are not shown as separate classes because of insufficient information on which to base detailed estimates for these groups. The total estimated number of family units in these two groups is 265,000, or 5.8% of all family units, with an estimated total expenditure of \$7,000,000. If these family units are not randomly distributed it might affect some of the figures shown in the tables.

For the purpose of preparing the estimates and compiling the tables, expenditures have been grouped into general classes based on the frequencies found in the sample. Expenditures for different items of health care are on different levels. Accordingly, the classes, into which amounts of expenditures have been grouped, are not uniform for all items. It was possible to show more detail for items where expenditures are fairly frequent whereas for other items estimates could be prepared for broad groups only, as in the case of Nursing care. This makes comparison between the distributions for various items more difficult, but it allows for the best possible analysis of each individual item. Average expenditures for the various items have been appended to the tables to facilitate interpretation of the data.

The material in this report is presented in three main sections. Section I gives the distribution, by expenditure group, for all family units, regardless of size of family unit and income group. Section II shows the distribution by expenditure group and size of family unit. Section III indicates the distribution by expenditure group and income group. In the latter Section the data for family units reporting "no income" and family units whose income was "not stated" are included in the totals but not shown separately for the reasons stated above.

An estimate was made of the number of family units reporting expenditures regardless of the amount paid, whether the payments were few or many and whether the expenditures were reported for one, several or all of the fourteen items of expenditure. This estimate is therefore an unduplicated count of family units reporting expenditures for any of the fourteen items and will be found in Table 1 on page 9 of the present bulletin. Similar estimates by size of family unit and by income group are shown in Tables 19 and 37 respectively (1).

Unduplicated counts were also obtained of family units making expenditures for any of the three types of prepayment plans; for any of the seven services; and, for drugs and appliances. These are presented in Tables 2, 6 and 14 respectively; by size of family unit in Tables 20, 24 and 32; and by income group in Tables 38, 42 and 50.

Tabulations on expenditures are not complete and fuller interpretation of the data will be possible as additional tabulations become available.

(1) The charts in each section of this report are based on these three tables.

Other terms used in this publication have the following meanings -

Household - a person or group of persons occupying a structurally separate set of living premises.

Expenditures for:

Prepayment Plans - premiums paid by individuals to medical care, hospital care and combined plans, including payments of a special tax for medical or hospital services where such a tax existed.

Physicians' Services - direct payments to general medical practitioners and specialists, excluding eye specialists. Payments for the services of osteopaths, chiropractors, etc., are excluded here but included under "Other".

Hospital Care - direct payments by individuals to hospitals.

Dental Services - direct payments for all types of dental care including dentures.

Eye Services - direct payments to physicians for eye services, as well as payments to optometrists and opticians. Cost of glasses is included.

Nursing Care - Home - direct payments for care by visiting nurses, including care by practical nurses but excluding payments for housekeeping services alone.

Nursing Care - Hospital - direct payments for private duty nursing only, in hospital.

Combined Bills - direct payments covering more than one specific type of service.

Drugs and Appliances - direct payments for medicine, appliances and other equipment used in case of illness, excluding household supplies such as food items or cosmetics. Excludes payments for medicine, included in the physician's or hospital bill where the cost of the medicine cannot be segregated.

Appliances and Equipment - direct payments for hearing aids, orthopedic appliances, bandages, dressings, and all other types of appliances and equipment used for medical care, excluding the cost of dentures and eye glasses (see above).

Other - health expenditures not specified above, including payments for physiotherapy or to osteopaths, chiropractors, etc.
